The word "Web" is rendered in a stylized, 3D font. The letters "W" and "e" are composed of multiple overlapping, semi-transparent layers in shades of red, orange, and yellow, creating a vibrant, multi-colored effect. The letters "b" and the second "e" are a solid, bright yellow. The text is set against a dark, solid background.

W3C Workshop Report: Blockchains and the Web

26 August 2016 | [Archive](#)

W3C published today the report of the W3C Blockchains and the Web workshop held on 29-30 June, 2016, in Cambridge, Massachusetts, USA. Participants at the workshop found many topics for possible standardization or incubation, including various aspects of identity and proof-of-existence, as well as smaller blockchain primitives that could increase interoperability across different distributed ledgers.

Discussion will continue in the Blockchain Community Group, which will coordinate across different communities and groups to foster standardization where needed, as discussed in the related blog post, "Building Blocks of Blockchains". This popular workshop had over one hundred attendees, and was hosted by MIT Media Lab and sponsored by NTT, Blockstream, and other W3C Members.

WAI: Strategies, guidelines, resources to make the Web accessible to people with disabilities

Web Content Accessibility Guidelines (WCAG) Overview

Web Content Accessibility Guidelines (WCAG) is developed through the [W3C process](#) in cooperation with individuals and organizations around the world, with a goal of proving a single shared standard for web content accessibility that meets the needs of individuals, organizations, and governments internationally.

The WCAG documents explain how to make web content more accessible to people with disabilities. Web "content" generally refers to the information in a web page or web application, including:

- natural information such as text, images, and sounds
- code or markup that defines structure, presentation, etc.

Who WCAG is for

WCAG is primarily intended for:

- Web content developers (page authors, site designers, etc.)
- Web authoring tool developers
- Web accessibility evaluation tool developers
- Others who want or need a standard for web accessibility

Related resources are intended to meet the needs of many different people, including policy makers, managers, researchers, and others.

WCAG is a technical standard, not an introduction to accessibility. For introductory material, see [Where should I start?](#) in the FAQ.

What is in WCAG 2.0

[WCAG 2.0](#) is a stable, referenceable technical standard. It has 12 guidelines that are organized under 4 principles: [perceivable](#), [operable](#), [understandable](#), and [robust](#). For each guideline, there are testable *success criteria*, which are at [three levels](#): A, AA, and AAA.

For a short summary of the WCAG 2.0 guidelines, see [WCAG 2.0 at a Glance](#).

To learn about web accessibility principles and guidelines, see [Accessibility Principles](#).

The WCAG 2.0 supporting technical materials include:
